Field of the Invention The present invention relates to a recording apparatus for recording an image by discharging ink. 2. Related Background Art There are various kinds of

recording apparatuses which record an image on a recording medium, such as a recording sheet. An ink jet recording apparatus is one of the recording apparatuses which records an image on a recording medium by discharging ink from a recording head. The recording head has an electro-thermal converting element which generates heat to evaporate ink. The recording head generates bubbles by heating the electro-thermal converting element, and generates ink droplets by the pressure of the bubbles. The ink droplets are ejected from a nozzle orifice and adhered to the recording medium. The nozzle orifice is formed at a front end portion of the recording head. In the recording head, the temperature of the electro-thermal converting element is lower than the temperature of the recording head. This is because the electro-thermal converting element has a low heat capacity and the heat is absorbed by ink. The temperature of the electro-thermal converting element rises to a level which is higher than the temperature of the recording head. The temperature of the electro-thermal converting element may rise to a level which is higher than the boiling point of the ink. If the temperature of the electro-thermal converting element rises to the level which is higher than the boiling point of the ink, the ink is vaporized at the nozzle orifice and then adheres to the electro-thermal converting element. If the bubble generation is repeated by the rise of the temperature of the electro-thermal converting element, the gas contained in the electro-thermal converting element is vaporized and the electro-thermal converting element is expanded. The electro-thermal converting element cannot maintain the thermal energy required for generating bubbles. As a result, it is difficult to eject ink droplets. In addition, the temperature of the recording head rises due to

heat radiation from the electro-thermal converting
element. Meet the Newest Twin Cities Philanthropists "As a
